Topic: flight ticket booking system

The basic functions that a flight ticket booking website should have is choosing location to which they wish to travel , their stating place and seeing available flights to that location and the timing

Once the user has choses their preferred flight user is redirected to a confirmation page then redirected to payment method

IF user has not logged in it will prompted that user has to login to proceed further

Here is a simple outline of home page crated after referring many

Ticket booking website like Emirates ,Qatar airways ,Air India etc.

(1) User can enter their locations to see all available flights
(2) User can scroll down to see more info about the said airways and such as info when it was founded etc.
(3) A nav bar which will be constant throughout the webpage where user can quickly access relevant objects such as home page, login/logout, etc.
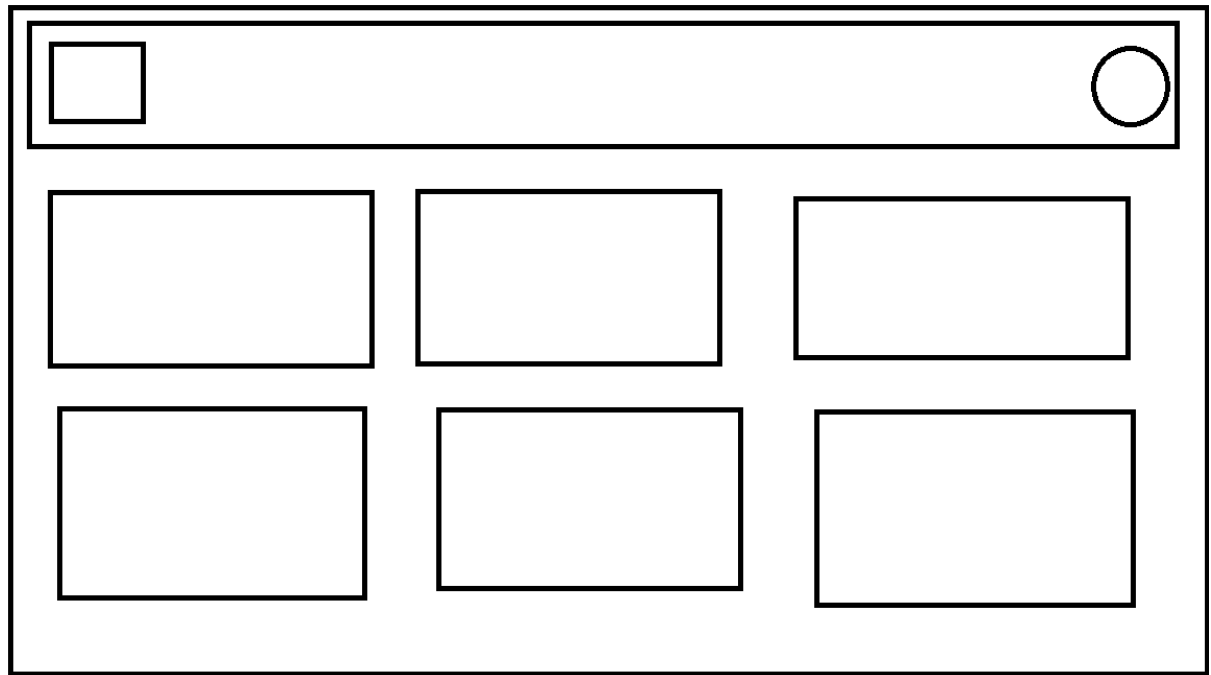

Sign Up

{baground image}

UserName:_____
Password:_____
Name:_____
Phno:_____
address:_____

Here we can see a simple sign-up form where user is requiring enter their personal information

Note: the navbar will automatically be hidden so it won't obscure the form

This is basic user dashboard where the user can see and manage active and past booking user and apply for refund quickly via this portal

The view method is in a grid-card layout by default, but user can switch between the view mode as user please from available ones

Here user can also edit your profile and change payment method etc.
